Capital has more toxic particles in its air than other major Indian metros

# DELHI IS INDIA'S ASTHMA CAPITAL

DELHI has the highest levels of Respirable Suspended Particulate Matter (RSPM) among the four metros, exposing its residents to a greater risk of asthma than people elsewhere in the country.

Acceptable levels of RSPM should not be more than 60 microgram (mg) per cubic meter (cu m) annually. In 2008, Delhi's

By Meenal Dubey in New Delhi

RSPM was recorded at a shocking 149 mg/cu m, according to a report published by the Central Pollution Control Board (CPCB) with the help of data collected between January and August 2008.

This is well above Mumbai's RSPM mark of 118 mg/cu m, Kolkata's 104 mg / cu m and Chennai's 54 mg/cu m.

It is no secret that India's capital is highly polluted; what's startling is the dangerous levels to which its air has been polluted leaving children vulnerable to respiratory disorders. Experts say this danger is showing no sign of abating.

Continued from page 1

That, in short, makes Delhi India's asthma capital. The reasons for this dubious distinction are not far to see. The city, with 5.5 million vehicles, handles far more traffic than all the other metros put together. More vehicles are added each day. This is a major contributing factor to the abnormally high concentration of pollutants in the air.

RSPM is made of air-borne particles bigger than 4 to 5 microns, which get attached to the nasal membrane and are prevented from entering the lungs. However, if these particles are smaller, they do not get blocked by the nasal tract, thus entering the lungs and causing various diseases. Combustion, burning of fossil fuels, vehicular pollution and emissions from power plants are the main sources of RSPM.

Ashwinita Roy Chaudhury, associate director at the Centre for Science and Environment (CSE), said, "The almost mindless addition of vehicles on the city's roads and the lack of a proper policy to counter this are adding to pollution."

## 'Vehicles are the main culprits for the high RSPM levels'

Construction activity also adds pollutants, but Delhi did not see significant construction activity last year to contribute to pollution. "Vehicles are the main culprit for the high RSPM levels," Roy Chaudhury said. It does not help that 18,000 trucks from other states enter Delhi everyday and add to the pollution levels.

She added, "Mumbai and Kolkata have a better public transport system. People there invest in car pools, while the bus, local train and tram systems are sound. Though the Metro has made some difference to Delhi, the city still has miles to go as far as pollution control is concerned."

The rise in the number of diesel vehicles has also dented Delhi's efforts to curb its RSPM levels.

CPCB member secretary J.S. Kamotyra said Delhi's pollution levels are monitored through two methods: manually and by continuous methods at monitoring stations located across the city. "For instance, at high-density traffic areas such as ITO, RSPM levels are measured on all 365 days using both methods. At

other locations we measure these levels at least twice a week."

The question though is that for a city that pioneered CNG usage, why are RSPM levels high? A senior CPCB official said: "Delhi has only one lakh CNG vehicles. The other 5.4 million vehicles are non-CNG. Is it any surprise that the city is polluted?"

Kolkata has the highest levels of nitrogen oxide (NO) levels at 63 mg/cu metre, while in Delhi it is 43 mg/cu metre in 2008. This is a significant increase from 2007,

## See what you breathe

A LOOK AT THE AMOUNT OF POLLUTANTS IN THE CAPITAL'S AIR

### Respirable Suspended Particulate Matter (RSPM)

| City    | 2006 | 2007 | 2008 (Jan-Aug) |
|---------|------|------|----------------|
| Delhi   | 136  | 159  | 149            |
| Kolkata | 100  | 99   | 104            |
| Mumbai  | 86   | 92   | 118            |
| Chennai | 57   | 37   | 54             |

### Sulphur Dioxide (SO<sub>2</sub>)

| City    | 2006 | 2007 | 2008 (Jan-Aug) |
|---------|------|------|----------------|
| Delhi   | 9    | 4    | 4              |
| Kolkata | 7    | 8    | 7              |
| Mumbai  | 9    | 11   | 8              |
| Chennai | 7    | 9    | 7              |

### Nitrogen Oxide (NO)

| City    | 2006 | 2007 | 2008 (Jan-Aug) |
|---------|------|------|----------------|
| Delhi   | 43   | 36   | 43             |
| Kolkata | 53   | 58   | 63             |
| Mumbai  | 29   | 40   | 34             |
| Chennai | 10   | 9    | 10             |

The figures are annual and should not exceed 60 microgram per cubic metre of air

when it was 36 mg/cu metre. Acceptable value of NO is 40 mg/cu metre. NO pollution affects the respiratory system causing bronchitis and damage to lung tissue.

The only good news in the CPCB report is that all four metros have done well to control sulphur dioxide (SO<sub>2</sub>) pollution. While the acceptable level is 60 mg/cu metre, Mumbai has 8 mg/cu metre, followed by Chennai and Kolkata at 7 mg/cu metre, while Delhi has the lowest at 4 mg/cu metre.

SO<sub>2</sub> reacts with other chemicals in the air to form tiny sulfate particles. Coal burning, smelting, manufacture of sulphuric acid, conversion of wood

## Govt says things will improve in 3 years

pulp etc. contribute to SO<sub>2</sub> pollution. When these particles are inhaled, they gather in the lungs and are associated with respira-

## MAIN CULPRITS

**80,000 vehicles** which enter Delhi from the National Capital Region daily. These include diesel-guzzling SUVs that emit thick smoke

**18,000 trucks** which enter city every day

## Children suffer

The Capital's polluted air is harming its children the most, with asthma cases rising among them

- The number of children with asthma has doubled over the past decade in the Capital
- Doctors blame the high levels of RSPM in the air for the attacks
- Dust and construction work squirt RSPM into the air. But those spewed by vehicles are the most harmful because of their small size
- RSPMs larger than 10 micrometres can't go past the nose or throat because of their size, but those less than one micrometre easily enter lungs
- Children are more susceptible to RSPMs than adults as they spend more time outdoors
- With their heart beating faster, children playing outdoor games tend to inhale more RSPMs

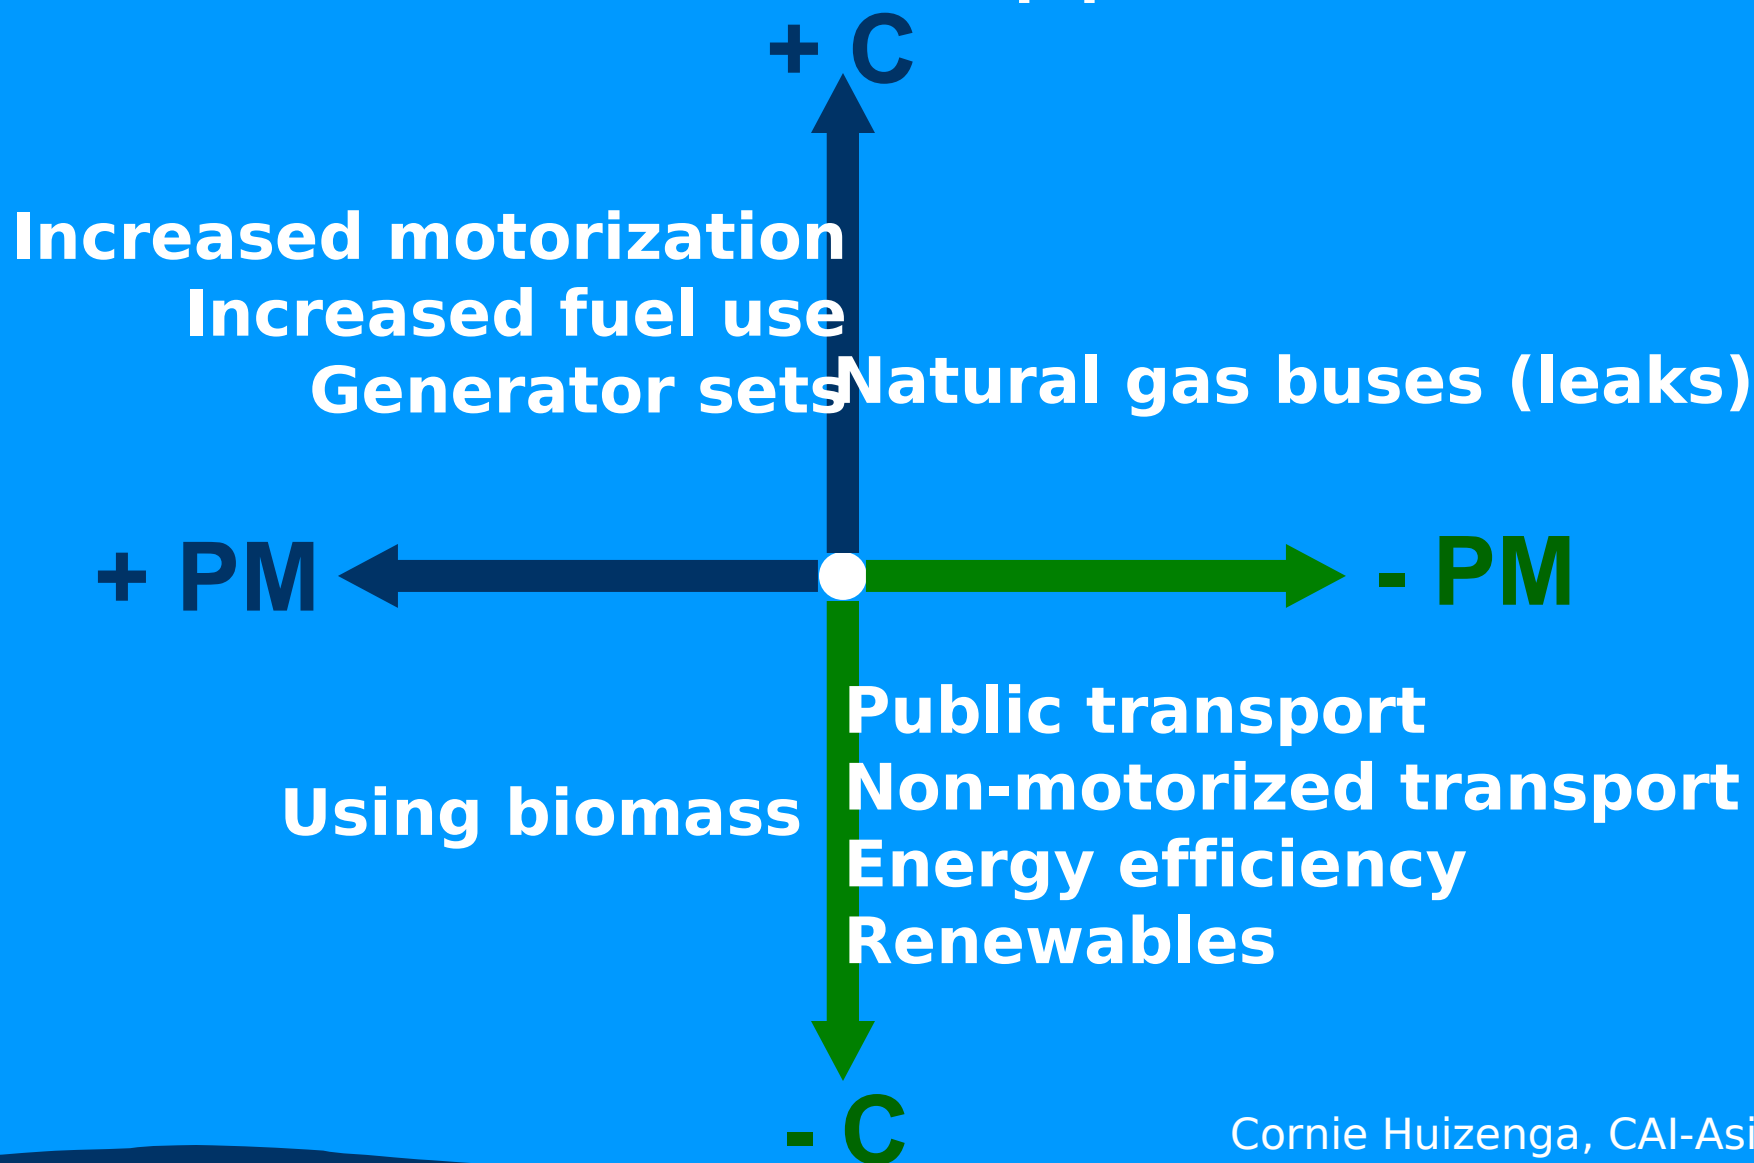

tory tract diseases, difficulty in breathing, and in extreme cases, premature death.

A senior government official said the government has given the nod to cleaner and better fuels, usage of Euro IV compliant in vehicles and also a revamp of the public transport system. "The Delhi Metro is a step in that direction," the official said. "Things will begin to improve in the next three years and the changes will be there for everyone to see."
