

# CATF: Powering a Realistic “Energy Transition”

August 2023

CLEAN AIR  
TASK FORCE

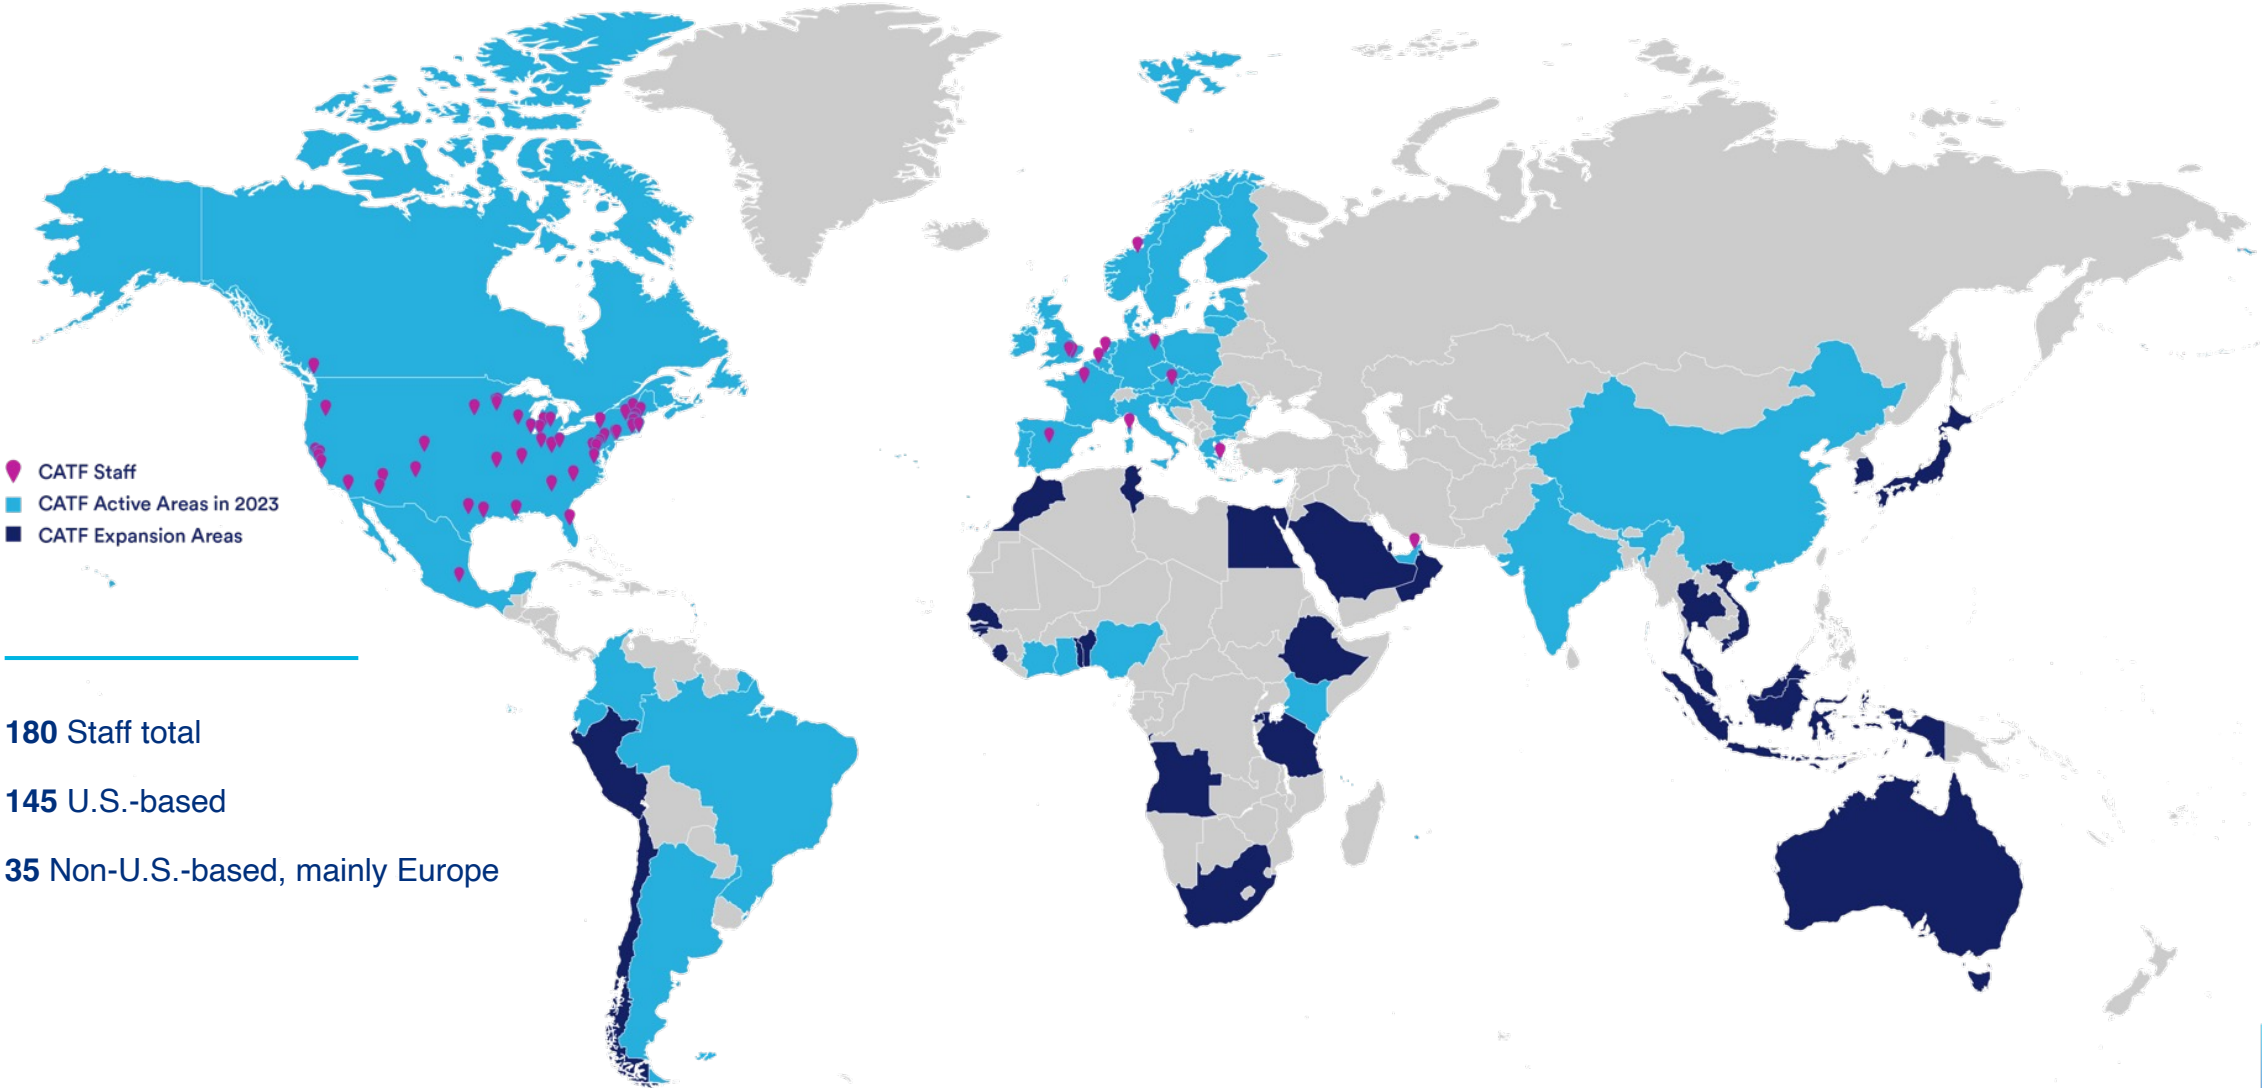

# CATF at a Glance

- **Founded in 1996** in Boston.
- **180 global staff:** analysts, advocates, engineers, community organizers, MBAs, lawyers, and more.
- **\$56 MM budget** for FY 2023, 100% funded by philanthropic donations.

**Mission:** Research and advocate for policies and private sector actions to manage climate change for a high-energy planet

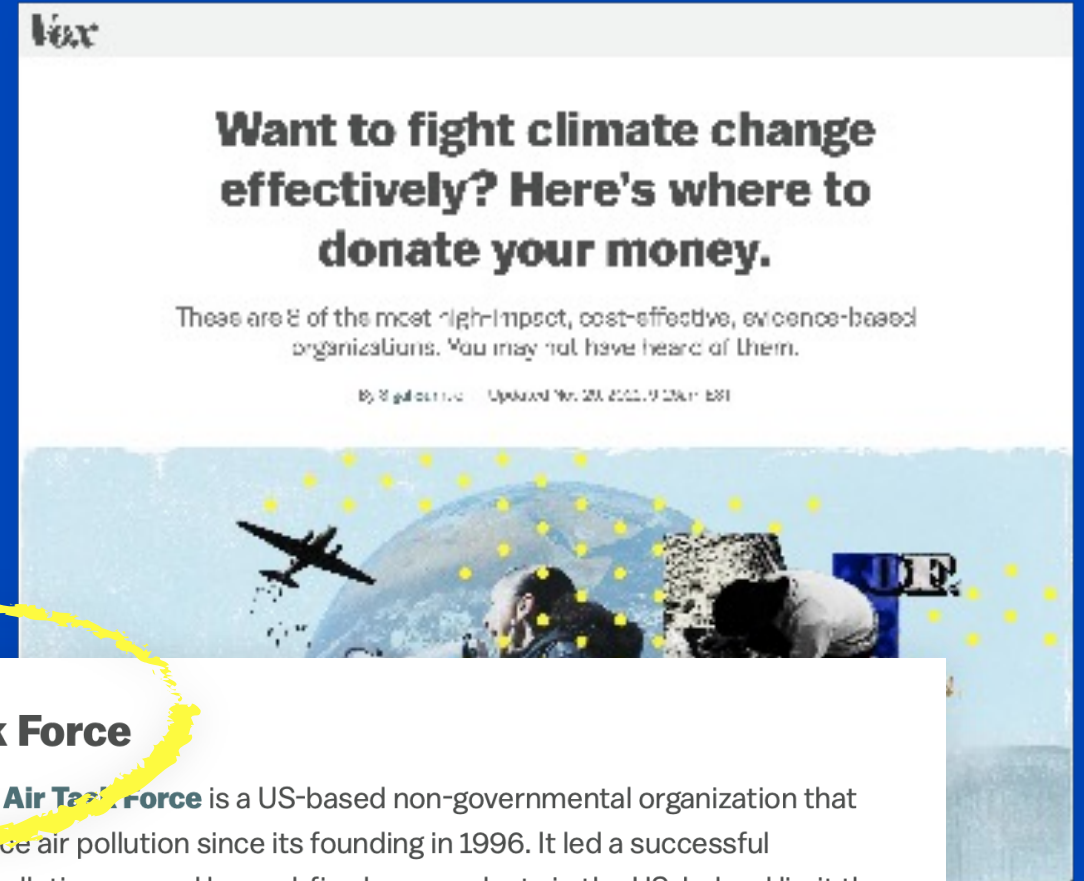

# CATF at a Glance

**180** Staff total  
**145** U.S.-based  
**35** Non-U.S.-based, mainly Europe

Vox names CATF  
#1 organization  
fighting climate  
change!

### 1) Clean Air Task Force

**What it does:** The **Clean Air Task Force** is a US-based non-governmental organization that has been working to reduce air pollution since its founding in 1996. It led a successful campaign to reduce the pollution caused by coal-fired power plants in the US, helped limit the US power sector's CO2 emissions, and helped establish regulations of diesel, shipping, and methane emissions. CATF also advocates for the adoption of neglected low- and zero-carbon technologies, from **advanced nuclear power** to **super-hot rock geothermal energy**. (Disclosure: I donated to CATF in 2021.)

# Major historic accomplishments

- Focused the USA's attention, and the world's, on coal
- Launched first global effort to manage methane
- Mainstreamed CCS in the climate discourse
- Put nuclear power back on the green agenda
- Turned the goal from “100% renewable” to “100% carbon free”
- First NGO to highlight need for zero carbon fuels
- Initiated unique catalytic efforts on superhot rock geothermal and fusion energy

# Recent accomplishments

- Played major role in designing and enacting the largest climate technology spend in history (US IRA - \$1 Trillion + IIJA)
- CATF vision for industrial carbon capture adopted by the EU
- Extended life of California's last nuclear plant, setting a global example
- CATF proposal for first-ever carbon limits on power plants adopted by US EPA
- Methane reduction policies driven by CATF cover 38% of natural gas production and cover 27% of total oil and gas methane emissions, and CATF-pushed methane import standards will cover 45% of globally traded gas.

What are some basic understandings and principles necessary for a realistic energy transition?

# The path to 1.5 degrees

# Reality

# CATF View of the “Energy Transition”

## Conventional view: it's simple, just need willpower

- Flatten or reduce demand globally
- Electrify everything
- Decarbonize power with ~ 100% renewable (wind + solar + batteries)
- Remaining fuels mostly “green hydrogen”
- Demand conforms to supply
- It's a straight line to 1.5 degrees and only requires “political will”

## CATF view: it's complicated and uncertain

- Demand could increase with developing world growth
- Electrification will be difficult in key sectors
- Very high renewables constrained by seasonality, cost, climate impacts, land, materials
- Demand patterns are sticky
- There are real financial constraints – we need to drive zero carbon **systems** as close as possible to “fossil fuel parity”
- It's a very wiggly line, outcomes are highly uncertain
- 1.5 degrees is out of view – we are now playing a much longer game
- Technology humility and pathway diversification and optionality is the best strategy

# Demand and electrification assumptions

The transition models assume **global demand reduction** rather than growth

**Figure 2.5** ▶ Total energy supply in the NZE

# Models rely on energy poverty in Global South, likely underestimating challenge

The figure above shows the projected average per capita energy consumption across regions in each category. These values are weighted averages across the models.

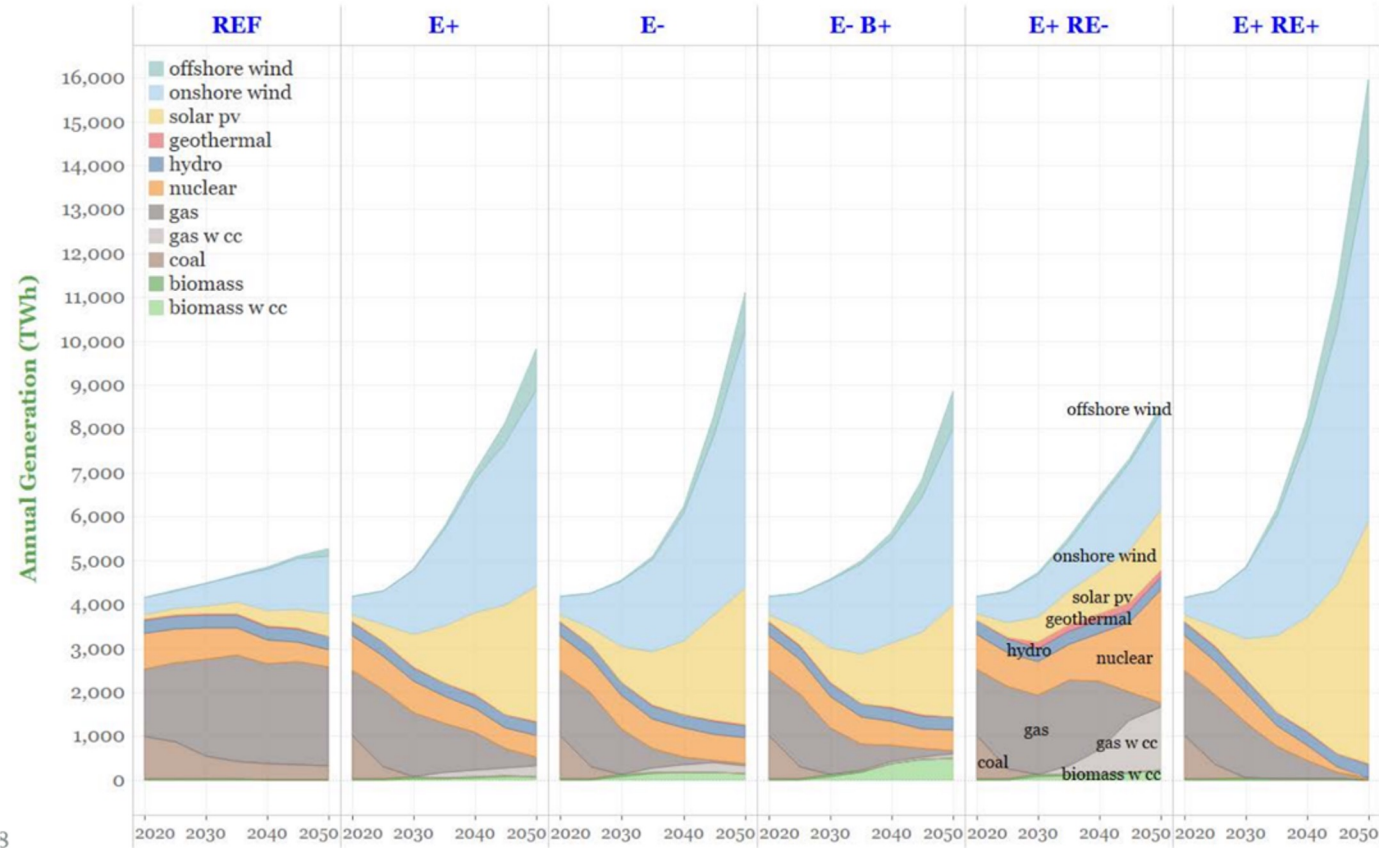

Kantkar et al, Equity Assessment of Global Mitigation Pathways in the IPCC Sixth Assessment Report (2022)

**How does the challenge look with a high-energy Global South?**

# Risks in the renewables- dominant transition supply vision

# Models assume a renewable dominant future

## Modeling of United States

## Modeling of EU

Capacity and generation mix in EU-27, 2017-50

Source: ??

## But renewable weekly, monthly, and seasonal patterns **lack cost-effective solutions**

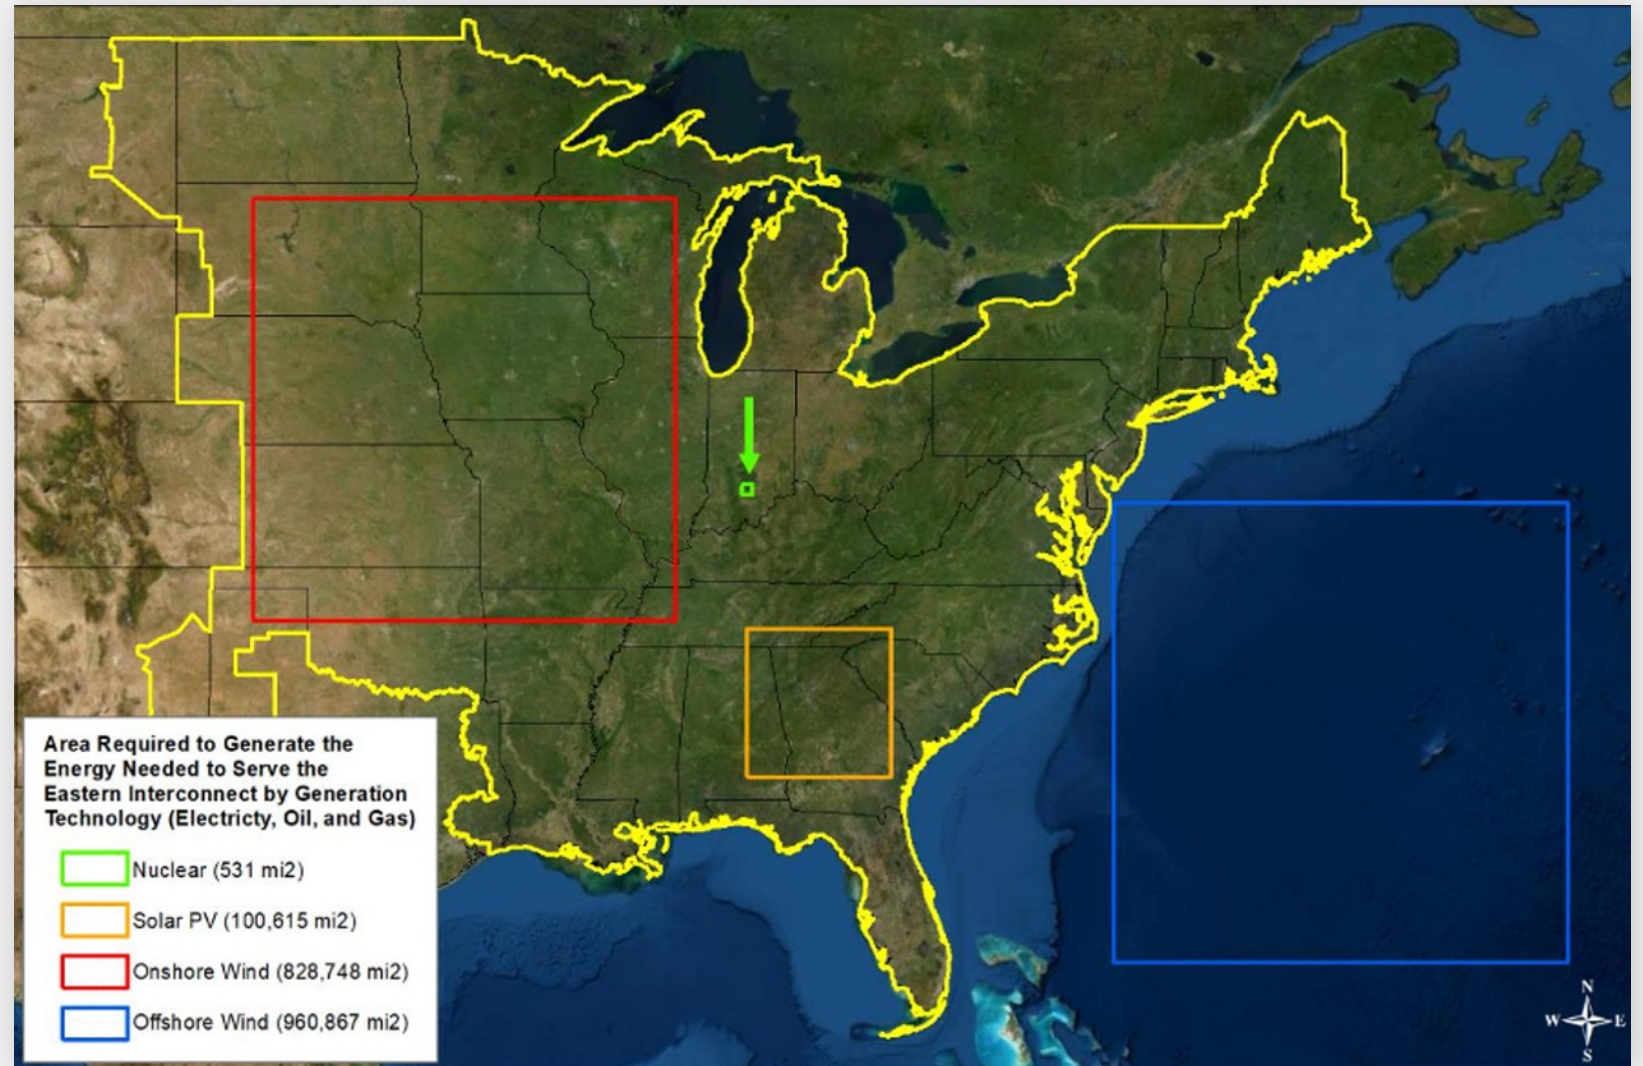

Source: Ref: Denholm et al., *The challenges of achieving a 100% renewable electricity system in the United States*, *Joule* (2021), <https://doi.org/10.1016/j.joule.2021.03.028>

Land will be a  
significant constraint

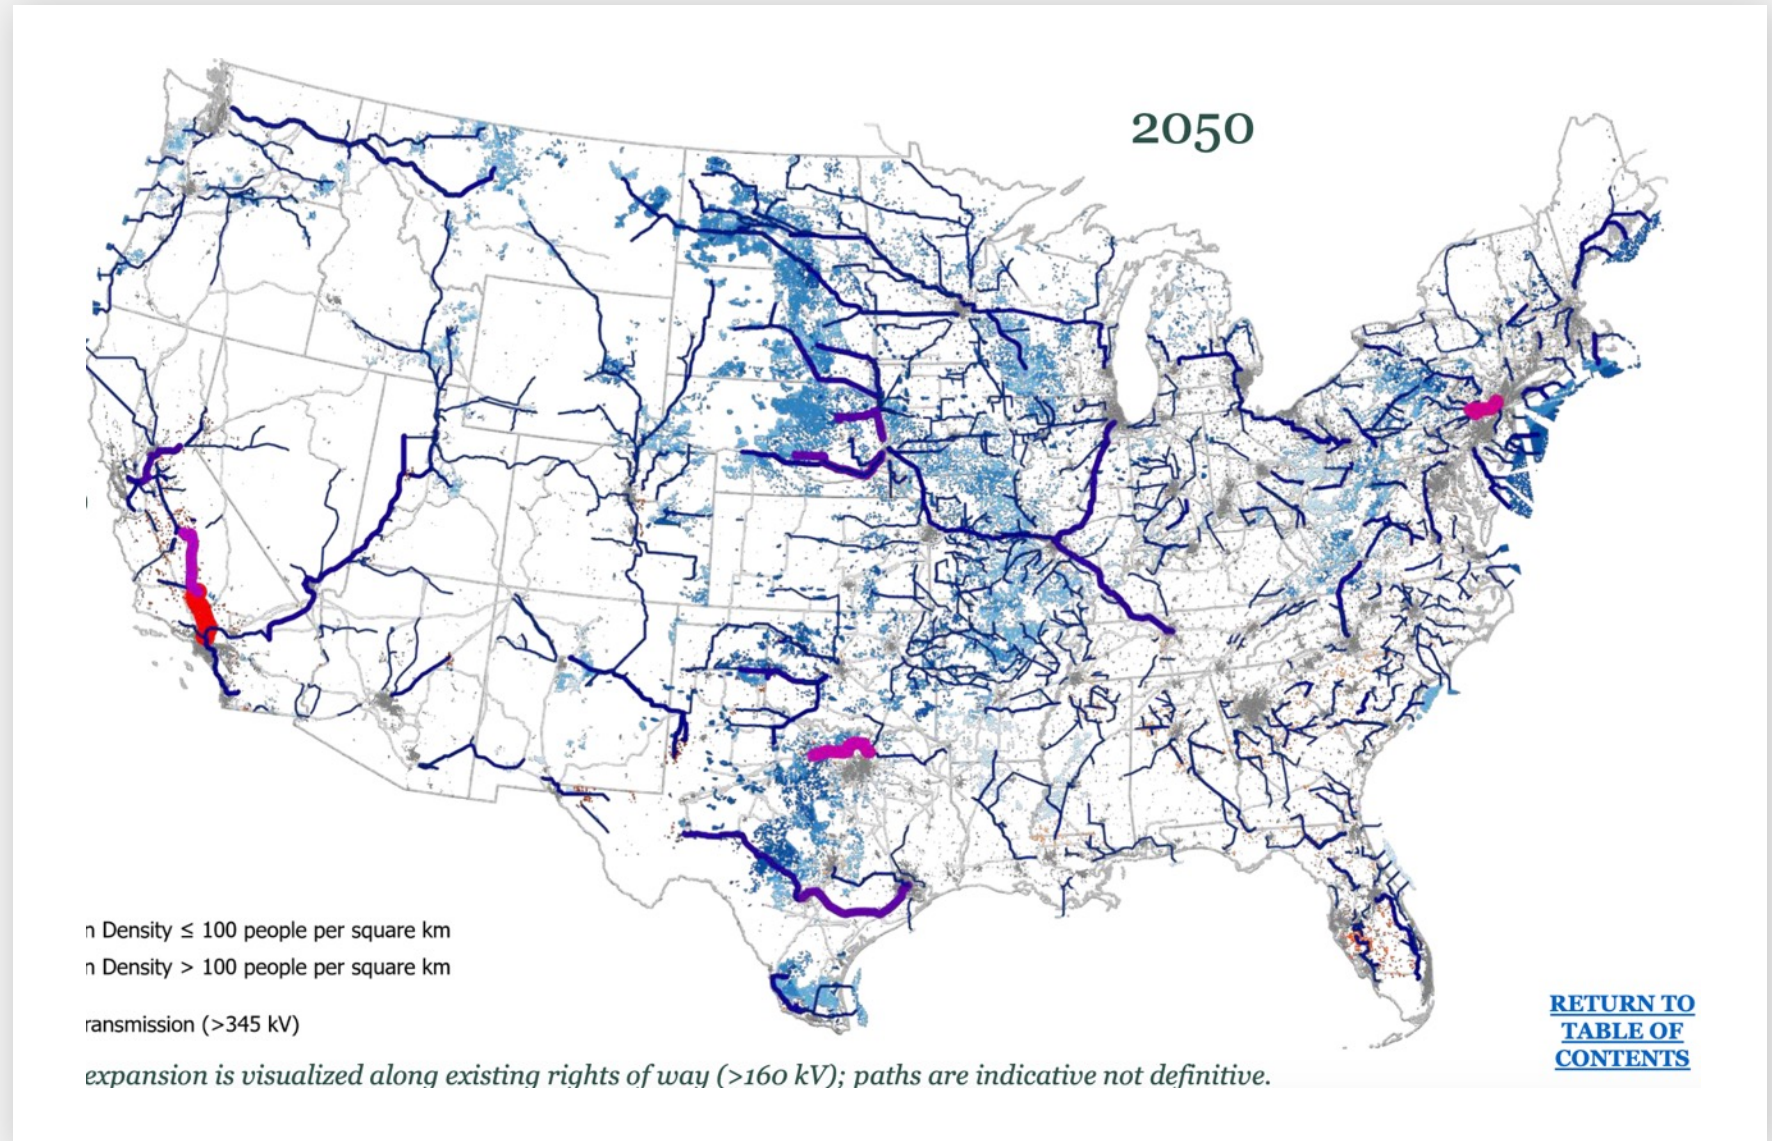

# Land-use challenges remain underappreciated – it's a crowded world

Renewables are  
land-consuming

## The U.S. high renewables buildout as modelled

# A European example

## Land Use Intensity of Energy

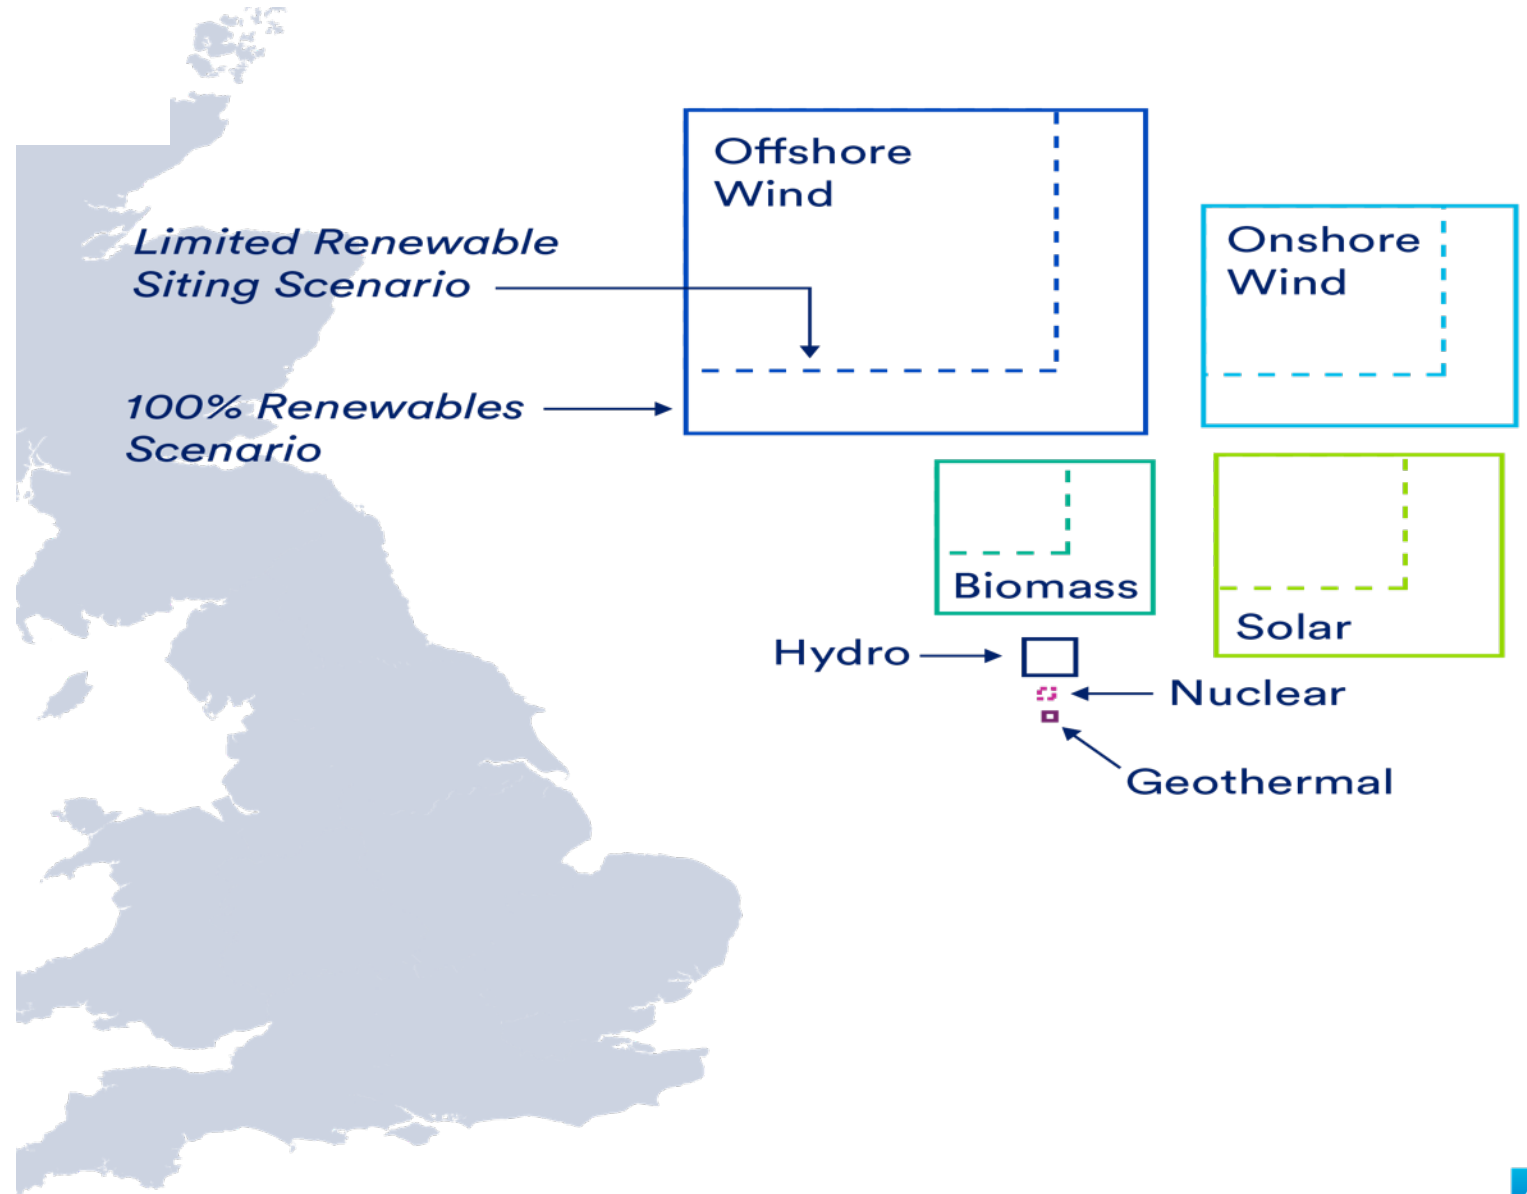

Carbon-Free Europe  
2050 UK Electric Capacity

### Limited Renewable Siting

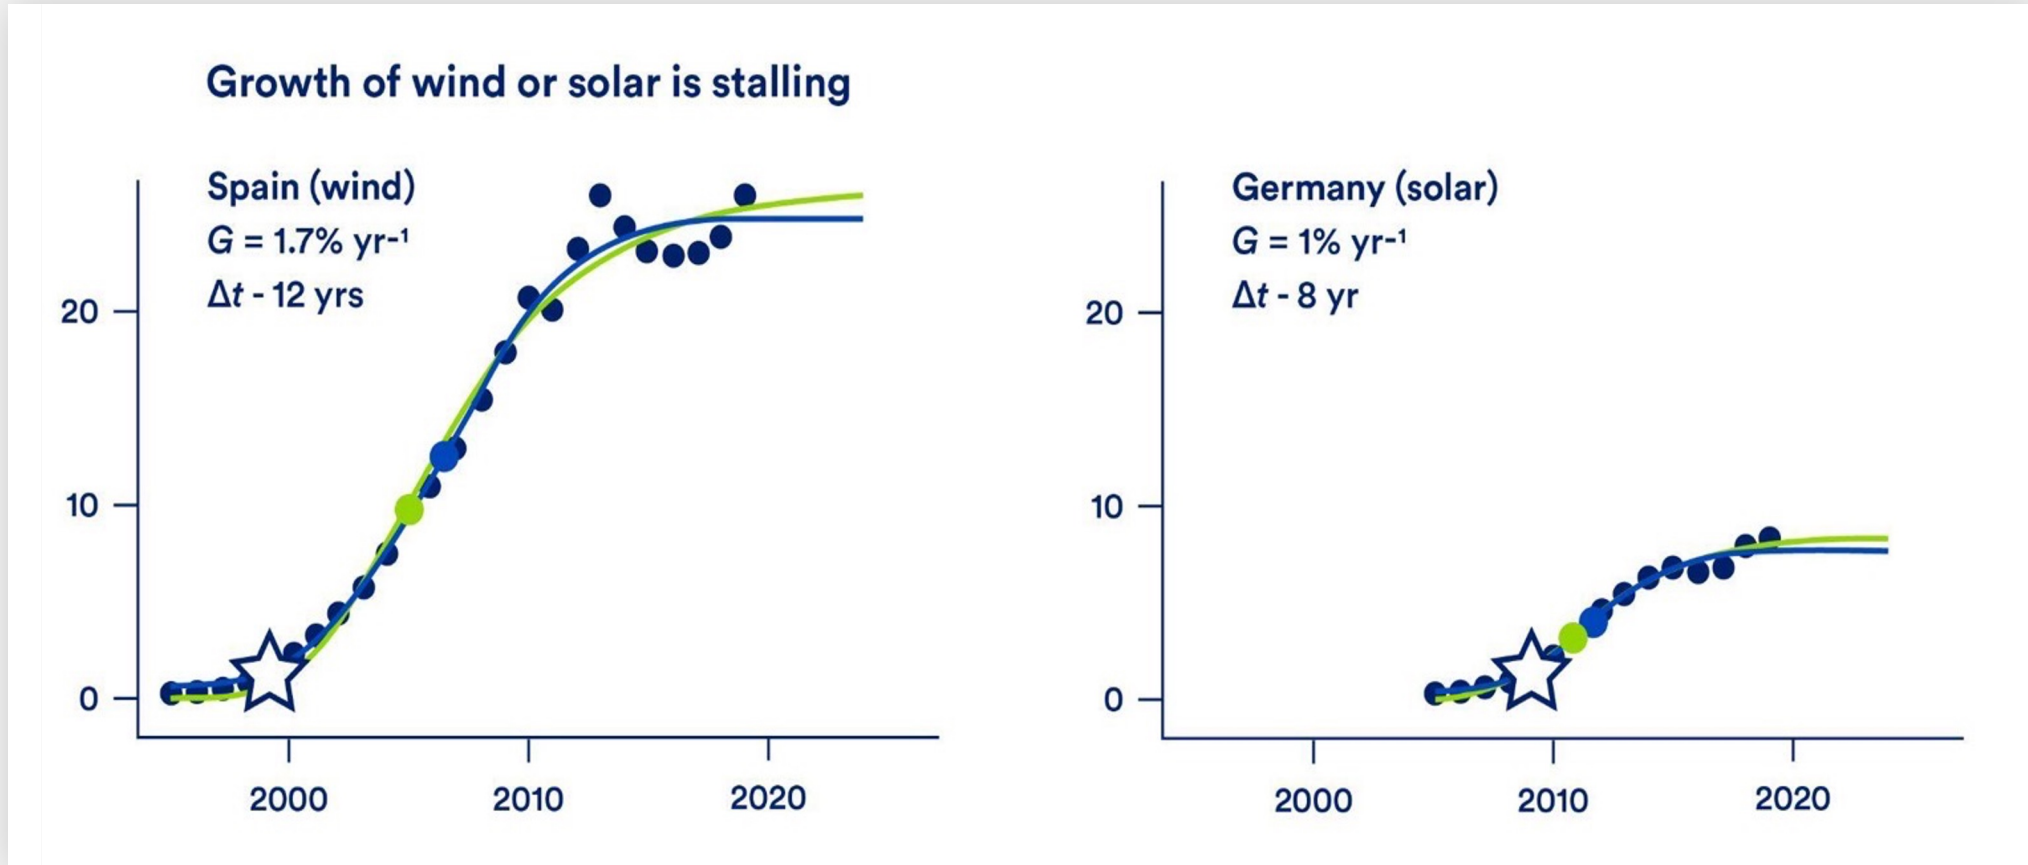

- Biomass – 8,446 km<sup>2</sup>
- Conv. Geothermal – 0.32 km<sup>2</sup>
- Hydroelectric – 1,317 km<sup>2</sup>
- Nuclear – 89 km<sup>2</sup>
- Offshore Wind – 66,938 km<sup>2</sup>
- Onshore Wind – 29,010 km<sup>2</sup>
- Solar PV – 17,750 km<sup>2</sup>

### 100% Renewables

- Biomass – 23,053 km<sup>2</sup>
- Conv. Geothermal – 65 km<sup>2</sup>
- Hydroelectric – 1,314 km<sup>2</sup>
- Offshore Wind – 102,518 km<sup>2</sup>
- Onshore Wind – 48,132 km<sup>2</sup>
- Solar PV – 40,194 km<sup>2</sup>

As a result, **renewable deployment rate has declined**  
(even before latest macroeconomic headwinds)

”Green hydrogen”  
for steel Direct Iron  
Reduction will take  
**substantial additional  
renewable, storage  
and electrolyzer  
capacity**

2 million ton/year  
green steel facility

2.5 GW offshore wind  
(Largest offshore wind  
facilities today ~ 1 GW)

300 MW storage

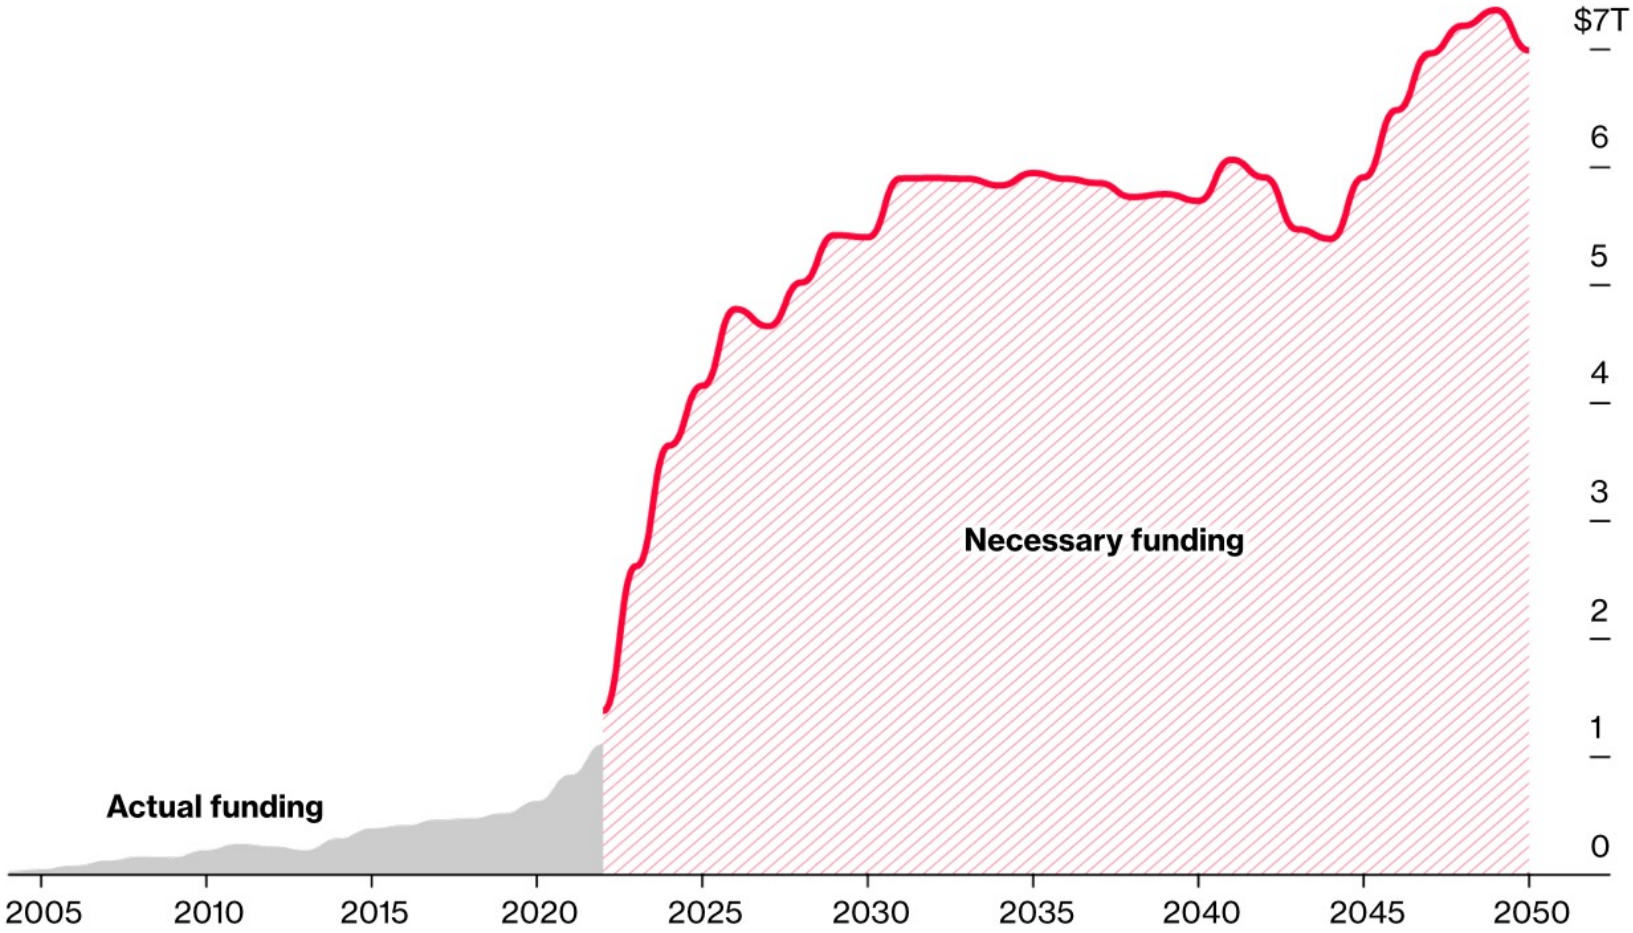

1.5GW electrolyzer  
(€2.5 - €3 Billion)

There are likely to be  
real financial constraints

**CCS can address a substantial portion of heavy industry**

**Important to nurture emerging technologies with potential high impact**

# Clean Air Task Force: How we work

**Change the Narrative:**  
to communicate the size of the problem and totality of solution requirements.

**Change Technology:**  
to have the full suite of options, including affordable and safe nuclear energy and decarbonized fossil fuels.

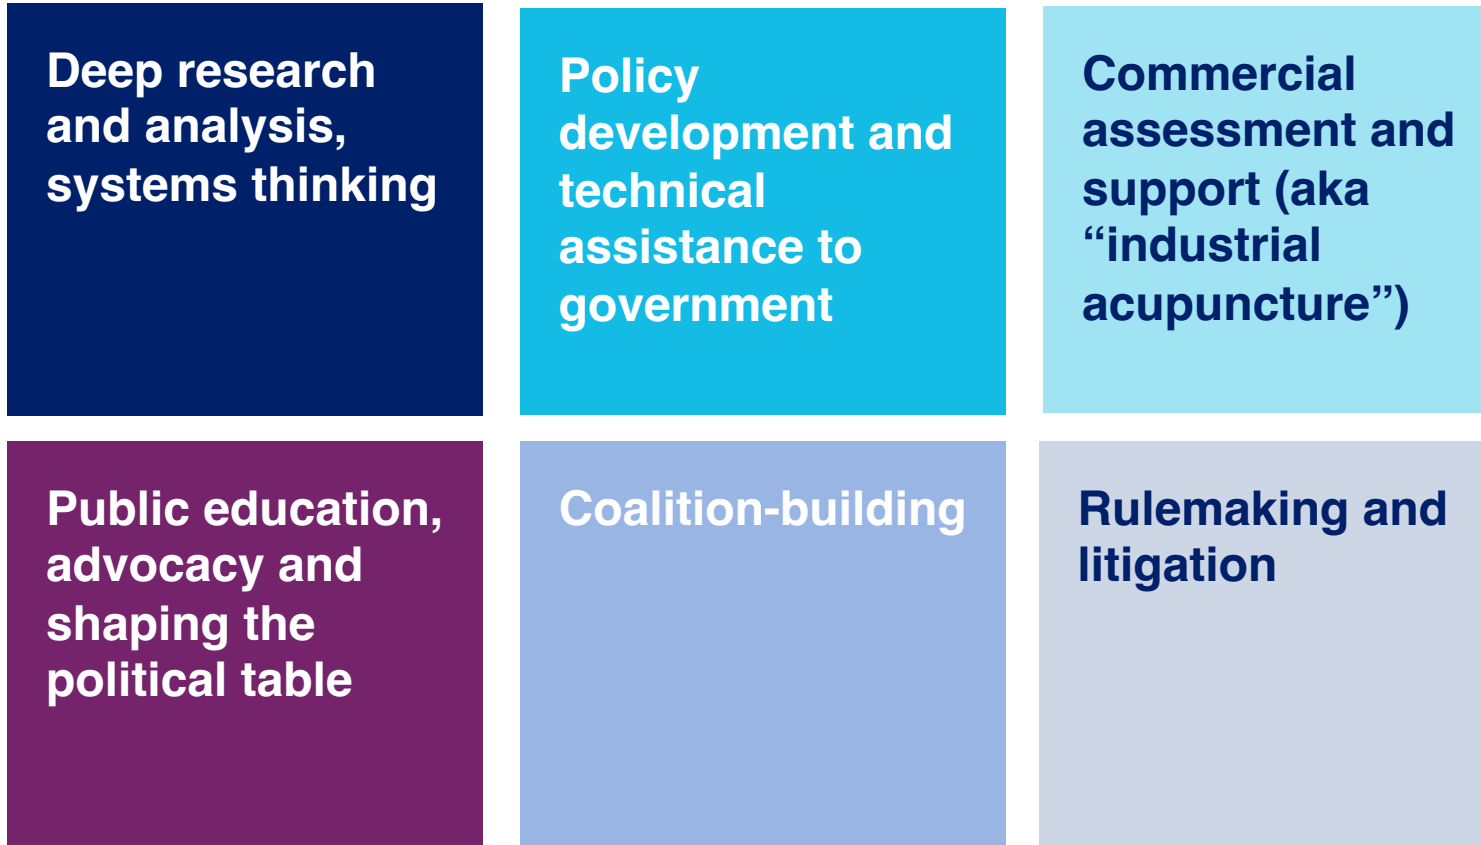

**Change Business Models:** to include modular, manufacturable energy systems that can be deployed anywhere quickly.

**Change Policy:**  
to develop, demonstrate, and scale the technologies and systems needed to achieve zero emissions by mid-century.

# Our building blocks for impact

# Building unlikely coalitions

# New initiatives (examples)

- **A demand-driven, growth-supporting climate strategy for African power sector**
- **Aggregate large aggregated global demand for nuclear power to enable a scalable, commoditized, learning industry**
- **Drive new approaches to siting clean energy infrastructure, beyond “acceptance”**
- **Grounding and dimensioning CDR with scientific understanding**
- **Bringing scientific rigor to the carbon “offset” market**
- **Engaging oil and gas industry on constructive low carbon pathways**
- **Deconstructing “climate finance” – whether, where and how we might raise \$7.5 Trillion a year**
- **Providing an alternative climate policy debate space to the Conference of the Parties**
